Interrogation Matin (PCC) P2I6 - Avril 2017

Durée totale: 15'
Documents autorisés: Aucun

Étudiant n° : Note : /8 Correcteur n° : Note de la correction : /2pt

1 Questions de cours (2Pts)

Barème : 1 bonne réponse par question. 1 si correct. Si plusieurs réponses : 0 points

Le protocole TCP est de type client-serveur. Il permet d'envoyer des données :

 \square du client au serveur \square du serveur au client $\square \sqrt{\text{dans les deux sens}}$ \square Aucun des trois

Si j'utilise SVN pour mon projet :

- □ Le code n'est stocké que sur mon ordinateur (en local)
- ☐ Le code n'est stocké que sur le serveur (distant)
- \square \checkmark Le code est sur les 2 emplacements
- \square Le code est DTC (dans ton cloud)

2 Application (6Pts)

Considérons le protocole suivant :

Implémenté par le serveur d'addition suivant, qui tourne sur la machine "192.168.1.42" :

```
import java.net.*;
import java.io.*;
public class Adder {
  public static void main(String[] args) {
      ServerSocket serverSocket = new ServerSocket(6660);
      Socket client = serverSocket.accept();
      PrintWriter out = new PrintWriter(client.getOutputStream(), true);
      BufferedReader in = new BufferedReader(new InputStreamReader(client.getInputStream()));
      int op1 = 0;
      int op2 = 0;
      String lu = in.readLine().trim();
      while(lu!=null && !lu.contains("=")) {
        // "Operand 1 : ".length() == 12
        if(lu.contains("Operand 1 : ")) { op1 = Integer.parseInt(lu.substring(12)); }
        if(lu.contains("Operand 2 : ")) { op2 = Integer.parseInt(lu.substring(12)); }
        lu = in.readLine().trim();
      out.println("Result : "+(op1+op2));
      client.close();
      serverSocket.close();
     catch (IOException e) {
      System.out.println("Erreur ...");
```

```
}
}
```

Écrivez un programme Java qui se connecte à ce serveur, demande à y calculer 12 + 30 et affiche la valeur du résultat (sans le texte "Result : ").

```
Suggestion de corrigé :
```

```
import java.io.*;
 import java.net.*;
public class Client {
                  public static void main(String[] args) {
                                      try {
                                           // Creation du socket et des flux d'entree/sortie
                                                        Socket socket = new Socket("192.168.1.42", 6660);
PrintWriter out = new PrintWriter(socket.getOutputStream(), true);
                                                         \textit{BufferedReader in = new BufferedReader(new InputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStreamReader(socket.getInputStream
                                                         // Envoie d'en message au serveur
out.println("Operand 1 : 12");
                                                         out.println("Operand 2 : 30");
                                                         out.println("=");
                                                         String res = in.readLine();
                                                         System.out.println(res.substring("Result : ".length()));
                                                          // Fermeture
                                                         socket.close();
                                      } catch (Exception e) {
                                                         System.out.println("Erreur");
```

Barème exercice 2

Gestion de la connexion :	/1
Choix correct des types de flux :	/1
Respect du protocole :	/1
Affichage correct:	/1
Le programme compile :	/1
Propreté :	/1
Note:	/6
